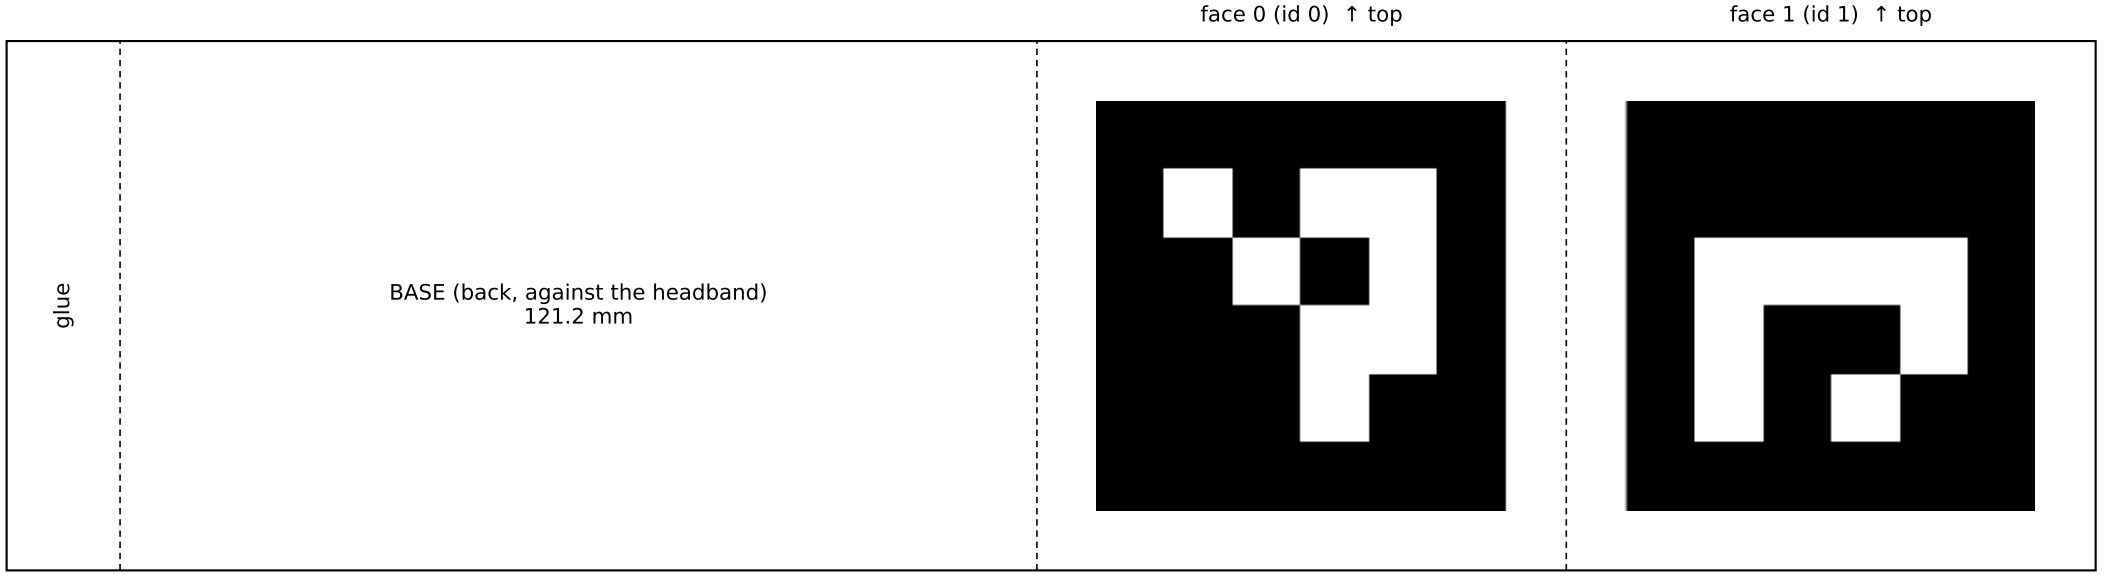
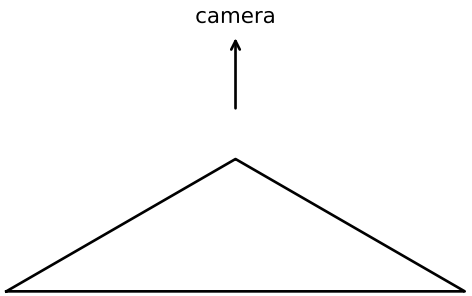
Marker tent for the head-tracking check (EchoHunt side paper)

1. Print at 100 % ("actual size", no fit-to-page). Check the scale bar below.
2. Glue the sheet to thin card (cereal box) before cutting, so the faces stay flat.
3. Cut along the solid outline. Score and fold every dashed line the same way, printed side outside, into a triangular tube: the line between the markers becomes the ridge.
4. Glue the tab inside, under the free edge of face 1. Faces flat, edges straight.
5. Check: the base should measure 121.2 mm between the two folds; the ridge angle is 120°.
6. Fix the base to the front of an elastic headband, high on the forehead at the hairline, ridge vertical and pointing straight forward, markers upright. It must not wobble.

Do not cover the eyebrows or eyes: the face trackers must still see the face.



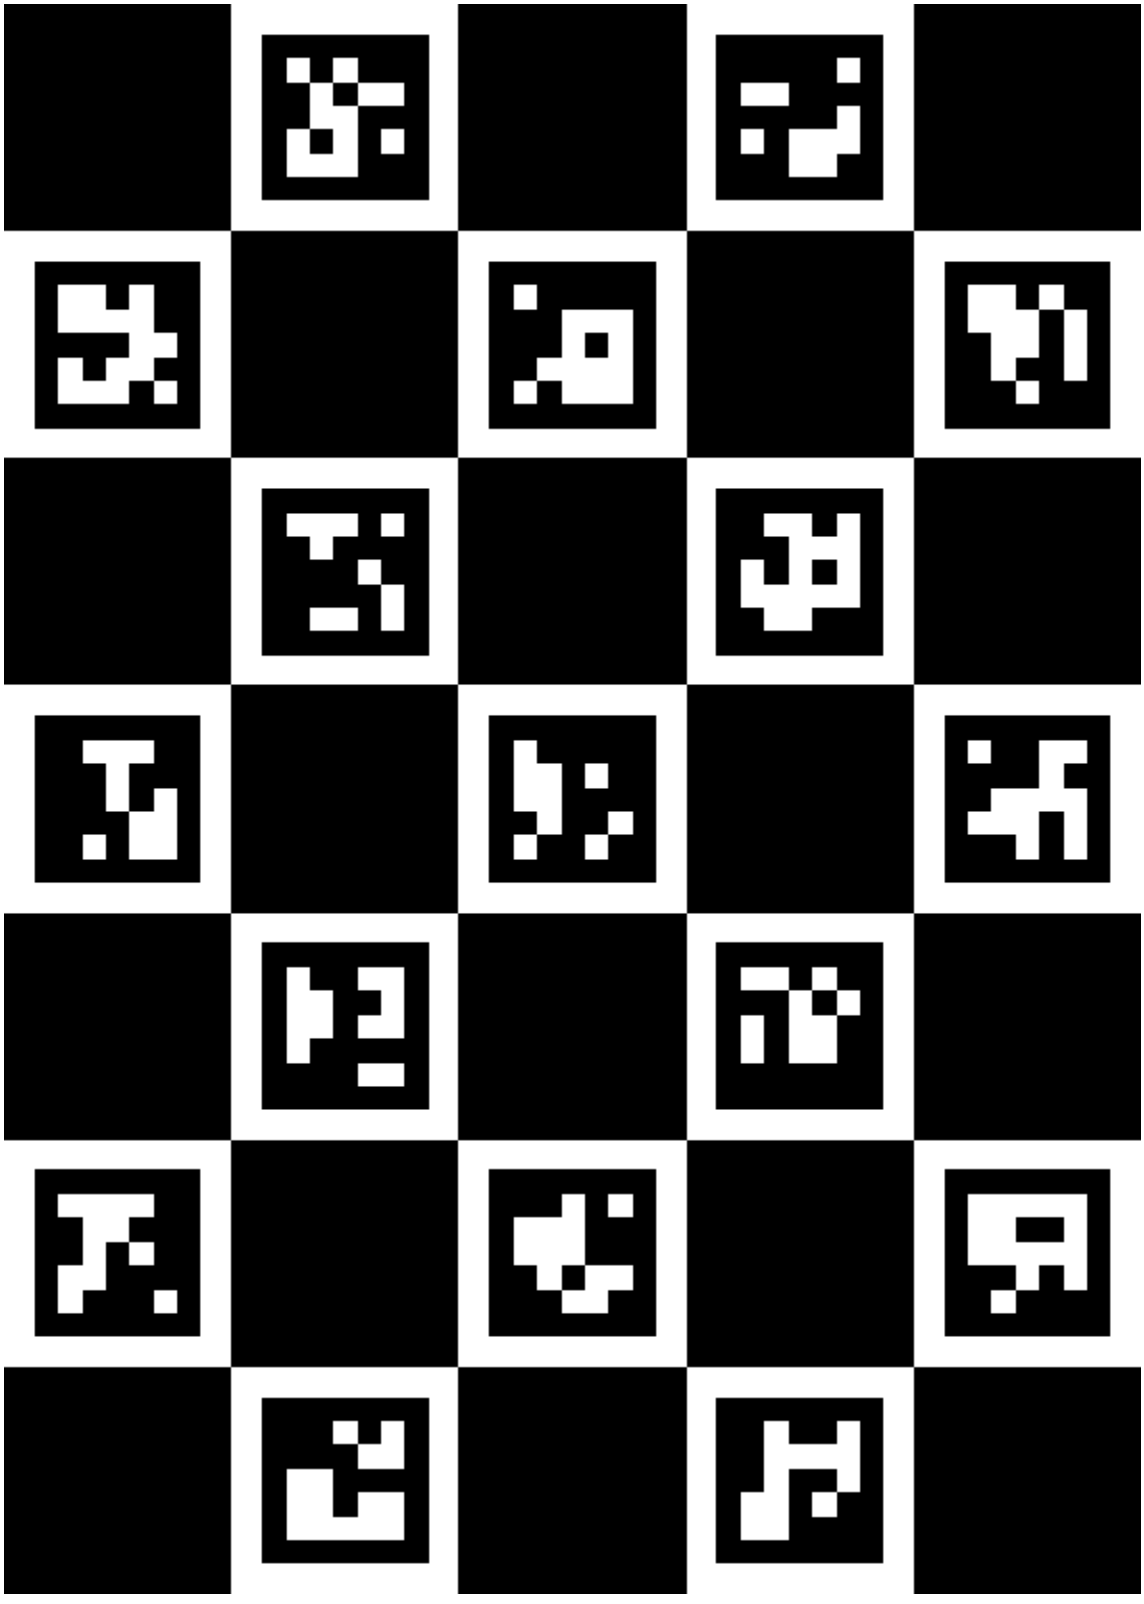
100 mm: measure this before use (must be 100 ± 0.5 mm)



top view when folded (half size): ridge toward the camera, faces 30° from frontal

Camera calibration board (ChArUco 5 × 7, 30 mm squares)

Print at 100 %, glue flat on card. Hold it in front of the Mac camera when asked, at several distances and tilts. The board must stay flat; a bent board spoils the calibration.



100 mm: measure this before use (must be 100 ± 0.5 mm)
